## DESCRIPTION

The academic conference held by the Sri Lanka Institute of Information Technology is called the International Conference on Application Frameworks (ICAF). ICAF is developed using MERN stack technology. It contains user friendly features and professional looking user interfaces. Frontend is created using React JS along with bootstrap framework for styling purposes. Backend is developed by Node JS with Express JS while Mongo DB is used for the database. Frontend communicates with backend using REST API running JSON based web services. Researchers get a chance to publish and present their latest findings of programming languages in this web application. Only registered users have the access to this application. When registering, user has to upload all necessary details and contact information. Researchers can submit their research papers, workshop presenter can conduct their workshops, editors can add or update conference details to the system, reviewers can view all uploaded research papers and workshops as well as approving or declining them and admin has the access to monitor all activities. Attendees and researchers have to pay for the conference.

# USER INTERFACE GUIDELINE

## Home page (IT19408316)

### ICAF

The International Conference on Application Framework (ICAF) is organized by the Faculty of Computing of the Sri Lanka Institute of Information Technology (SLIT) as an open forum for academics along with industry professionals to present the latest findings and research output and practical deployments in the Computer Science and Information Technology domains. Primary objective of the ICAF is to uplift the research culture and the quality of research done by Sri Lankan researchers. This conference will create a platform for national and international researchers to showcase their research output, networking opportunities to discuss innovative ideas, and initiate collaborative work. ICAF 2019 and ICAF 2020 were successfully conducted with a technical co-sponsorship by IEEE Sri Lanka Section and all publications are available in IEEE Xplore digital library.

### Objectives

- To promote advanced research culture among academic and cooperate community around the globe.
- To showcase research achievements of our researchers locally and internationally.
- To create a platform for networking and collaborative research and development activities among national and international researchers.
- To encourage services to the society through innovative products and new inventions.

- When user access to the system they will be direct to the home page.

### UPCOMING WORKSHOPS

#### WorkShop Title: Security of Mobile Cloud Computing Models

<b>Description</b>	Mobile cloud computing (MCC) is a trending technology employed in several domains to overcome the limitations of mobile devices by using cloud capabilities. Communication between mobile devices and clouds is maintained via wireless media to make use of cloud services. Hence, MCC models show vital security issues related to many disciplines, especially authentication, privacy, and trust. Current MCC models lack the ability to secure and protect data, resources, communication channels, and authentication (client-to-cloud and cloud-to-client). MCC security issues have appeared mainly as a result of the integration between mobile devices and cloud computing. cloud-to-client authentication issues are disregarded by existing MCC models, existing MCC models tend to address some but not all security issues, and related MCC model surveys do not sufficiently address comprehensive MCC security issues such as securing and protecting data, resources, and communication channels. This workshop will discuss an important resource regarding MCC security issues for model developers and practitioners for future research and designs.
<b>Presenters</b>	Dr. Ransalu Senanayake
<b>Date</b>	Invalid date
<b>Estimated Duration</b>	2 days
<b>Payment Amount</b>	100 \$

#### WorkShop Title: The Challenges of IoT Addressing Security, Ethics, Privacy, and Laws

<b>Description</b>	Internet of Things or IoT is a rapidly growing network of interconnected 'things' embedded with sensors to collect and exchange data over the internet without the need for human intervention. As the applications of IoT continue to skyrocket, it introduces major security, ethical, privacy, and legal challenges that have a substantial impact on our lives. There is a need for a comprehensive overview covering all of these challenges. This workshop will provide a clear overview of the security, ethical, and privacy challenges faced by the common users and examines the current and emerging IoT laws and standards enacted by governments across different countries to combat the vulnerabilities of IoT. Trust and the potential challenges of smart contracts have also been discussed. In addition, the multitude of use cases described in this paper provides an insight into how the threats and vulnerabilities of IoT influence our lives.
<b>Presenters</b>	Dr. Darshana Kasthurirathne
<b>Date</b>	2021-07-25
<b>Estimated Duration</b>	2 days
<b>Payment Amount</b>	120 \$

- Any users have access to this.
- Upcoming workshop and details which are approved by the admin will display in this page.

**Title** Software-defined networks for resource allocation in cloud computing  
**Description** Cloud computing has a shared set of resources, including physical servers, networks, storage, and user applications. Resource allocation is a critical issue for cloud computing, especially in Infrastructure-as-a-Service (IaaS). The decision-making process in the cloud computing network is non-trivial as it is handled by switches and routers. Moreover, the network concept drifts resulting from changing user demands are among the problems affecting cloud computing. The cloud data center needs agile and elastic network control functions with control of computing resources to ensure proper virtual machine (VM) operations, traffic performance, and energy conservation. Software-Defined Network (SDN) offers new opportunities to blueprint resource management to handle cloud services allocation while dynamically updating traffic requirements of running VMs.

Dynamic Microservices to Create Scalable and Fault Tolerance Architecture

One of the industry's most important trends in enterprise architecture is related to the use of microservices, to the detriment of monolithic architectures, which are beginning to no longer be used. Due the cloud-native architectures the deployment of microservices systems is more productive, flexible and cost effective. Anyway, a lot of companies started to migrate from one type of architecture to another, but it is still in the early phase. In this paper we address the challenges raised by the need to develop a scalable and fault tolerance system based on microservices.

Navodya Pasqual	0713456789	navodyapasqual@gmail.com	Development and psychometric evaluation of the cloud computing	Cloud computing is a new technology that drives libraries to create and share knowledge, leading to the cost reduction, easy management, and unlimited data storage capacity. Given the importance of cloud computing technology and the lack of tools to investigate the factors affecting cloud computing acceptance in academic libraries; therefore, the aim of present study was to perform the development and psychometric evaluation of the cloud computing technology acceptance questionnaire for academic libraries. How a tool was designed to evaluate the acceptance of cloud computing technology in academic libraries. Due to the fact that this tool has acceptable validity and reliability, it can be used in various studies and surveys.	<a href="#">show</a>	Mr. Mohammad KarimSaber	2	240	approved	2021-08-04
